

Mission Scientist Report 11 June 2013

Submitted by wpetersen on Wed, 06/12/2013 - 08:52

Date:

Wednesday, June 12, 2013 - 08:45

Discussion:

Dry and boring day for the most part. Some scattered shower activity in the domain but no special scanning completed. Ran RAINs back to back in afternoon for expected activity-but it did not materialize (too capped).

Did two webinars, one with Steve Nesbitt, who visited the radar today for several hours.

All instruments ran fine; but no real solid action to speak of, sans weaker shower activity that seemed to confine itself to the southwest and northeast quadrants in the afternoon and into the early evening. If you are a gravity wave fan, there were some interesting signatures in the afternoon after 2 PM (even some lenticular clouds along one mid-level wave).

12 June report will have more in it re.precip and stormsmost assuredly.
